

THE 5C™ QUICK-START WORKSHEET

One building. Thirty minutes. See where your data & digital infrastructure actually stands.

A free diagnostic from *Peak Property Performance*® — Amazon Best Seller from Fast Company Press.

How to use this worksheet: Pick one property. Block thirty minutes. Answer honestly — not aspirationally. Each question maps to one of the five C's (Clarify, Connect, Collect, Coordinate, Control), scored 1–5. Your total puts you in one of four tiers with the next play to run. Self-assessment, not a sales call.

QUESTION 1 · CLARIFY

Do you know who owns the operational data your building produces — and could you prove it in a courtroom?

Who has rights to the BMS data, access logs, energy submeter readings, tenant usage telemetry, network traffic data? If a vendor went out of business tomorrow, could you walk away with everything they collected for you?

- 1 I'd have to ask the property manager or IT vendor.
- 2 Some data we own, some the vendors do — never mapped.
- 3 Most data is in our name but I can't quickly produce an export.
- 4 We've mapped ownership at the contract level and have export rights.
- 5 We own it. We can export on demand. We've tested doing so.

Your Question 1 score: _____

QUESTION 2 · CONNECT

Do your buildings share a single, owner-controlled network design — or does each one run its own setup?

When you walk from building #1 to building #5, are the network topologies, segmentation rules, vendor access protocols, and admin credentials the same? Or does each property feel like a different country?

- 1 Every building is bespoke. Different vendors, different rules.
- 2 We have a 'preferred vendor' but each install ends up custom.
- 3 We have a standard on paper but practice varies by property.
- 4 Most buildings follow the same design with documented exceptions.
- 5 One standard. Repeatable. Owner-controlled. Vendor-agnostic.

Your Question 2 score: _____

QUESTION 3 · COLLECT

Could you compare a single operational metric across every building in your portfolio?

Pick one: energy per square foot, ticket resolution time, tenant Wi-Fi sessions, access events. Could you produce a chart of that metric, building-by-building, in less than a week without hiring a consultant?

- 1 No. Data is siloed by vendor and property.
- 2 Maybe — after a major manual cleanup.
- 3 Yes for one or two metrics the vendor dashboards happen to expose.
- 4 Yes for most operational metrics, with some manual work.
- 5 Yes, normalized, on demand, across every property.

Your Question 3 score: _____

QUESTION 4 · COORDINATE

If a new vendor shows up tomorrow wanting access to your building's data, do you have a clear policy that tells you whether to say yes — and on what terms?

This means: identity rules (who they talk to), access rules (what systems they touch), privacy rules (what data they see), retention rules (how long they keep it), rules of use (what they do with it). Documented. Followed.

- 1 We negotiate vendor access ad-hoc, building by building.
- 2 We have a vendor onboarding checklist — mostly procurement.
- 3 We have governance rules — inconsistently enforced.
- 4 Documented governance, applied consistently, in vendor agreements.
- 5 Governance is automatic. Every vendor signs the same data charter.

Your Question 4 score: _____

QUESTION 5 · CONTROL

Could you swap out a major system vendor — BMS, access control, tenant app, energy management — within 90 days without losing operational continuity?

This means: are your systems vendor-locked or vendor-pluggable? If a BMS vendor doubled prices tomorrow, could you migrate to a competitor in a quarter, or are you trapped?

- 1 Switching any major vendor would take a year and rebuild every integration.
- 2 We could switch with significant pain and consultant fees.
- 3 One or two systems within 90 days; most are deeply embedded.
- 4 Most systems are decoupled enough that a 90-day swap is realistic.
- 5 Every system is vendor-pluggable by design. Owner-controlled. Swap-ready.

Your Question 5 score: _____

Your total: Add all five scores. **Total:** _____ / 25

WHAT YOUR SCORE MEANS**COLD START 5–10**

Beginning of the playbook — and that's an advantage. No technical debt around the wrong vendor choices. The first move sets the standard for everything after.

Next play: Pick one building. Run a Clarify pass — map every system, vendor, data flow, credential. The artifact becomes your template.

Read first: *Clarify* (Ch. 3).

CONTENDER 16–20

Running a real operation — not a compounding one yet. Most buildings follow a similar pattern. You produce most operational reports across the portfolio. Ahead of nearly every CRE owner.

Next play: Build the data layer that makes the portfolio more valuable than the sum of its buildings — normalized data plane and the governance to let AI act on it.

Read first: *Collect* (Ch. 5) & *Control* (Ch. 7).

CATCHING UP 11–15

You've started, but you haven't standardized. Some good systems, some good data — but inconsistency, lock-in, and vendor-platform data you don't fully control.

Next play: Stop adding properties to your stack until you've standardized. Codify your strongest building. Write the contract clauses you wish you'd negotiated harder.

Read first: *Connect* (Ch. 4) & *Coordinate* (Ch. 6).

CHAMPION 21–25

Running the playbook at the level most owners only talk about. Owner-controlled infrastructure. Standardized design. Normalized data. Documented governance. Vendor-pluggable systems.

Next play: Formalize what you've built into an operating manual that survives leadership turnover. Document data & digital infrastructure as a separately-valued portfolio asset.

Read first: *Champion* (Ch. 8).

Want a professional read-out?

Request a complimentary PPP Review. We'll run the Clarify pass on one of your buildings and deliver a one-pager you can act on Monday.
